

The **Osborne Head Support System** originally designed by Dr. Osborne of Duke University assists physicians with myelographic and computed tomographic exams. It is used by many other specialists as a useful tool for other procedures.

Osborne

The **Osborne** Head Support System consists of a headrest mounted on a support stand. A chin piece adds more stability and comfort. Four knobs allow adjustment of the headrest to control precisely the angle of the face piece. The headrest is comfortable, and provides a good airway for tubing and wire mechanisms. Its design eliminates the "closed in" feeling common with other methods of positioning. The Osborne is also available as a 45° fixed angle model.

Goniometric Osborne

The **Goniometric Osborne** provides a significant improvement to the original Osborne: a goniometer for precise measurement of the neck. In addition, the chin may be placed at any of three heights to facilitate greater extension or flexion.

Improved Duncan

The **Improved Duncan** doubles the thickness of the Plexiglas cradle and adds rubber channeling to the rocker legs to help avoid slippage. Because of its added strength, it is better suited for more intensive uses.

Duncan

The **Original Duncan** Headrest is perfect when treatment is less intensive and less frequent. Made of translucent Plexiglas material and open cell foam.

Disposable paper covers are recommended with all devices.

Adjustable Supine

The **Adjustable Supine** is ideal for precise positioning of the patient's head. It consists of a headrest mounted on a support stand. Four knobs allow adjustment of the headrest to control the height and angle of the headrest.

The patient's head may be raised from one to nine centimeters off the table surface. The patient's head may also be tilted up to 20 degrees forward or backward.

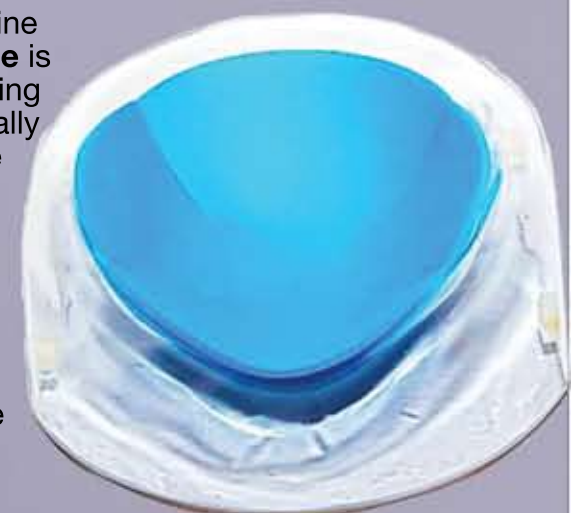

The Adjustable Supine may also be ordered with Velcro straps to hold the patient's chin in a three-point position.

Supine

In contrast to generic foam supine positioners, the Plexiglas **Supine** is ideal when choosing a long lasting cleanable device. Ideal for virtually any kind of treatment where the patient must lay supine.

The Supine with its foam pad places the patient's head in the proper position for certain comfort and control.

Replacement pads are available for supine devices.
